

PROCESS FOR MAKING AN ALDEHYDE

The present application is a continuation-in-part of pending application U.S.S.N. 10/302,636 filed November 22, 2002, the entire contents of which is herein
5 incorporated by reference, which claims priority from the provisional application U.S.S.N. 60/334,588 filed December 3, 2001, now abandoned.

The present invention relates to a process for reacting a dihalogenated compound with an organic sulfoxide compound to form an aldehyde compound.
10

Background of the Invention

Aromatic aldehyde compounds are useful for making numerous other compounds, as well as for their own properties. For example, in Method A shown in the description below an aldehyde undergoes chemical reactions to form a
15 compound which is a cPLA₂ inhibitor having a variety of therapeutic uses, as described below. It is often necessary or desirable to obtain such an aldehyde from a corresponding dihalogenated aromatic compound.

Certain methods for converting a dihalogenated aromatic compound to its
20 corresponding aldehyde are known. Typically, they require harsh reaction conditions, which generally involve high temperatures and as a strong acid, such as concentrated sulfuric acid, or a strong base, such as aqueous sodium hydroxide. Examples of these methods are found in Chung and Kim, *Tetrahedron*, 1995, 51(46), 12549-12562, and Goodman, et al., *J. Am. Chem. Soc.*, 1995, 117, 8447-8455.

25 Conversion of dihalo aromatics to aldehydes has been shown to occur by reaction with sodium carbonate (Adediran, et al., *Bioorg. Med. Chem.*, 2001, 42, 1175-1183), and with sodium bicarbonate (Langer, et al., *Bioorg. Med. Chem.*, 2001, 9, 677-694), with heavy metal salts like silver nitrate (Semmelhack, et al., *J. Am. Chem. Soc.* 1994, 116, 7108).
30

It has been reported that benzal bromides may be hydrolyzed to the corresponding benzaldehyde using potassium carbonate in dimethylsulfoxide

(DMSO) solvent (Huaping Xi, et al., *J. Org. Chem.*, 1999, 64(29), 9286-9288). In this reaction, the potassium carbonate hydrolyzed the dibromo compounds to the corresponding aldehydes.

5 Harsh reaction conditions are not suitable for all dihalogenated aromatics because undesirable side reactions may occur. Furthermore, it is safer and less expensive to avoid using strong acids and bases and high temperatures. Although mild reaction conditions have been reported, development of good procedures for such transformation is desirable.

10

 Sulfoxides are often used as an oxygen-donating agent in organic synthesis, for example, to convert structurally diverse alcohols to their corresponding carbonyl compounds in the presence of activating reagents, such as transition metal catalysts (Steinhoff, et al., *J. Amer. Chem. Soc.*, 2002, 124(5), 766-767; Arterburn and Perry, 15 *Org. Lett.*, 1999, 1(5), 769-771.), or dicyclohexylcarbodiimide (Pfitzner and Moffatt, *J. Amer. Chem. Soc.*, 1965, 87(24), 5661-5670). Activation is necessary for the sulfoxide to effect the desired transformation.

Summary of the Invention

The present invention comprises reacting a dihalomethyl compound with a sulfoxide in the absence of an effective amount of an activating reagent to form the corresponding aldehyde, as shown in the reaction:

wherein

AA represents an aryl group, or non-aromatic functional groups such as alkenyl or alkynyl group;

X represents F, Cl, Br, or I; and

R_A and R_B are each an alkyl or aryl group independently selected from the group consisting of C₁-C₆ alkyl optionally substituted by a C₄-C₈ cycloalkyl or phenyl group, C₄-C₈ cycloalkyl optionally substituted by up to two C₁-C₃ alkyl groups, and phenyl optionally substituted by up to five C₁-C₃ alkyl groups. R_A and R_B also may have one or more chiral centers.

An activating reagent is any chemical entity that interacts chemically with the sulfoxide to promote oxygen transfer from the sulfoxide to the dihalogenated aromatic compound. Activating agents may include transition metal catalysts, acids, bases, dehydration agents, and organic or inorganic entities that will form a complex or transition state with DMSO.

The compounds of formula (I) inhibit cPLA2 activity that is required for supplying arachidonic acid substrate to cyclooxygenase -1 or 2 and 5-lipoxygenase, which in turn initiate the production of prostaglandins and leukotrienes respectively. In addition, cPLA2 activity is essential for producing the lyso-phospholipid that is the precursor to PAF. Thus these compounds are useful in the treatment and prevention of disease states in which leukotrienes, prostaglandins or PAF are involved. Moreover, in diseases where more than one of these agents plays a role, a cPLA2 inhibitor would be expected to be more efficacious than leukotriene, prostaglandin or PAF receptor antagonists and also more effective than cyclooxygenase or 5-lipoxygenase inhibitors.

30 These compounds will be especially useful in the treatment of arthritic and/or rheumatic disorders, including but not limited to rheumatoid arthritis, spondyloarthropathies, gouty arthritis, osteoarthritis, systemic lupus erythematosus and juvenile arthritis. The compounds of this invention will be useful in the treatment of

post-operative inflammation including that following ophthalmic surgery such as cataract surgery or refractive surgery.

Method A

Method A

The initial indole of Method A may be alkylated at the C3 position (the carbon atom at the 3-position of the indole moiety) with aldehydes or the corresponding acetals in the presence of a Lewis or Bronsted acid, such as boron trifluoride etherate or trifluoroacetic acid. The indole nitrogen may then be alkylated by treatment with a strong base such as sodium bis(trimethylsilyl) amide, n-BuLi, sodium hydride or potassium hydride in a solvent such as DMF, DMSO or THF followed by exposure to the appropriate alkyl halide. The resulting product can be treated with carbon tetrabromide in carbon tetrachloride and a catalytic amount of benzoyl peroxide to effect dibromination of the C2 methyl group. The dibromide can then either be stirred with silver carbonate in acetone water or poured into DMSO and stirred. Both of these procedures generate the aldehyde which is then subjected to the nitro aldol reaction with nitromethane and a catalytic amount of ammonium acetate at reflux. The resulting vinyl nitro intermediate is reduced to the amine upon treatment with zinc mercury amalgam in a mixture of THF and conc. HCL at reflux. This amine can then be treated with the requisite sulfonyl chloride under biphasic conditions, aqueous sodium bicarbonate/ dichloromethane, or in organic solvent with the addition of a hindered organic amine base. The final hydrolysis was accomplished under basic conditions with sodium hydroxide in water and methanol and THF at room temperature or at elevated temperature. Alternatively it may be cleaved by treatment with sodium thiomethoxide in a solvent such as THF or DMF at elevated temperatures (50°C - 100°C). This method was used in the synthesis of Examples 1-88.

Method B**Method B**

The initial halide of Method B is refluxed in aqueous sodium sulfite and a suitable cosolvent if necessary, such as alcohol, dioxane etc, for the required amount of time to form the desired sodium sulfonate. This intermediate was treated with thionyl chloride, phosphorous pentachloride or oxalyl chloride, in dichloromethane with a small amount of DMF and stirred for several hours at room temperature until the sulfonyl chloride is formed. The thus formed sulfonyl chloride is then used crude in Method A. This method was used in the synthesis of Examples 1-88 when the sulfonyl chloride was not commercially available.

Example 1: 4-[2-(1-Benzhydryl-2-{2-[(benzylsulfonyl)amino]ethyl}-5-chloro-1H-indol-3-yl)ethoxy]benzoic acid

This synthesis is depicted in Method A.

Step 1: To 4-hydroxy-benzoic acid methyl ester (1.0 eq) in DMF (0.83 M) was added K_2CO_3 (2.0 eq) followed by 2-bromo-1,1-diethoxy-ethane and the reaction mixture was stirred at 110°C for 2 days. TLC showed a new spot. The reaction mixture was diluted with ethyl acetate, washed with 1N NaOH, water, and brine, dried over sodium sulfate, and solvent was removed to afford desired product in 84 % yield. This material was used in the next step without further purification.

Step 2: To the above product (1.0 eq) and 5-chloro-2-methyl indole (1.0 eq) in CH_2Cl_2 (0.12 M) was added triethylsilane (3.0 eq) followed by trifluoroacetic acid (3.0 eq). After being stirred overnight at room temperature, added water and trifluoroacetic acid (1.0 eq) to the reaction mixture, stirred at room temperature for two days, diluted with CH_2Cl_2 , washed with 1N NaOH, water, brine, dried over sodium sulfate. Trituration of the material with CH_2Cl_2 and hexanes afforded the C3 alkylated indole in 92% yield

Step 3: To the indole from above (1.0 eq) in DMF (0.36 M) at 25 °C was added NaH (1.2 eq, 60 % dispersion in oil), and the brown solution was stirred at 0 to -5 °C for 1 h and then compound bromodiphenylmethane was added (1.1 eq), and then the reaction mixture was stirred overnight. It was then quenched with water, diluted with ethyl acetate, washed with water and brine, dried over sodium sulfate and purified by column chromatography to yield 72 % of the desired product.

Step 4: To the N-alkylated indole from above (1.0 eq) in CCl₄ (0.2 M) was added N-bromosuccinimide (2.0 eq) and a catalytic amount of benzoyl peroxide. The solution was heated to reflux for 3h, cooled to 25 °C, filtered, and the solid was washed with CCl₄. The filtrate was concentrated to a foam, which was dried. The foam was dissolved in acetone, and Ag₂CO₃ (1.1 eq.) was added followed by water and the reaction mixture was stirred overnight at room temperature. It was filtered and washed with acetone. The filtrate was concentrated to a residue, to which was added water. This mixture was extracted with ethyl acetate, washed with brine, dried over sodium sulfate and then chromatographic purification on the residue gave the desired product in 85 % yield. Alternatively the dibromide from the reaction with NBS could be poured into DMSO (10-20% concentration by weight) stirred for 30 minutes at room temperature. When the reaction was deemed complete it was poured into water and the resulting precipitate was isolated by filtration, the cake was washed with water and dried to yield an essentially quantitative yield.

Step 5: To the above aldehyde (1.0 equiv) in CH₃NO₂ (0.2 M) was added ammonium acetate (4 equiv) and the resulting mixture was heated to reflux for 4 h. The reaction mixture was then diluted with EtOAc and washed with brine. The aqueous phase was extracted with EtOAc. The combined organic extracts were washed with brine, dried over sodium sulfate, and concentrated until an orange crystalline solid precipitated. The mixture was refrigerated overnight and the nitroolefin (76% yield) was collected by filtration. Evaporation of the solution phase and purification of the residue by column chromatography (gradient elution 100% toluene → 1% EtOAc-toluene) afforded an additional amount of the nitroolefin (23% yield).

Step 6: Zinc dust (20 equiv) was suspended in 5% aqueous HCl solution (8 M Zn/5% HCl). To this mixture was added HgCl₂ (0.28 equiv). The mixture was shaken for 10 min, the aqueous phase was decanted and replaced with fresh 5% HCl, and again the mixture was shaken for 5 min and the aqueous phase was removed. The zinc-mercury amalgam thus generated was then added to a mixture of the nitroolefin (1.0 equiv) and conc. HCl (80 equiv) in THF (0.04 M nitroolefin/THF). The mixture was maintained at a gentle reflux for 1 h. The formation of product was followed by TLC analysis. The mixture was cooled to room temperature and the solids were removed by filtration through Celite. Conc. NH₄OH was added to the solution phase and the mixture was concentrated on the rotary evaporator. The residue was dissolved in CH₂Cl₂ and conc. NH₄OH. The aqueous phase was extracted with CH₂Cl₂, and the organic phase was washed with brine, dried over sodium sulfate, and concentrated. Purification by column chromatography afforded the desired product (65% yield).

Step 7: To methyl 4-{2-[2-(2-aminoethyl)-1-benzhydryl-5-chloro-1H-indol-3-yl]ethoxy}benzoate (1.0 equiv) and sat. NaHCO₃ (0.14 M) in CH₂Cl₂ (0.07 M) was added α -toluenesulfonyl chloride (1.0 equiv). After 1 h the mixture was poured into saturated sodium bicarbonate and extracted with CH₂Cl₂. The combined organic phase was washed with brine, dried over sodium sulfate and purified by column chromatography (gradient elution using 20% EtOAc-hexanes \rightarrow 50% EtOAc-hexanes) to afford 86% of the desired product.

Step 8: The resulting ester was hydrolyzed by stirring with 1N NaOH (5 equiv) in THF (0.07 M) and enough MeOH to produce a clear solution. The reaction was monitored by TLC (10% MeOH-CH₂Cl₂) for the disappearance of starting material. The mixture was heated in a 60 degrees C oil bath for 2 hour. The mixture was concentrated, diluted with H₂O, and acidified to pH 2-4 using 1 M HCl. The aqueous phase was extracted with EtOAc and the organic phase was washed with brine, dried over sodium sulfate, and concentrated to afford the desired product in 92% yield. HRMS calc for [C₃₉H₃₅ClN₂O₅.S + H] 679.2028 found 679.2031.

Example 42: 4-{3-[1-Benzhydryl-5-chloro-2-(2-phenylmethanesulfonylamino-ethyl)-1H-indol-3-yl]-propyl}-benzoic acid

30 Step 1: A mixture of methyl-4-iodobenzoate (5.3g, 20.2 mmol), allyl alcohol (1.78g, 30.3 mmol), $NaHCO_3$ (4.24g, 50.5mmol), $Pd(OAc)_2$ (0.14g, 0.60mmol), (n-Bu) $_4NBr$ (6.55g, 20.2 mmol) and 4-A molecular Sieves (4.1g) in anhydrous DMF (69mL) was stirred at room temperature for 4 days. The reaction mixture was filtered

through celite and the filtrate poured onto water and extracted with EtOAc. Organic layer was washed with brine, dried (Na_2SO_4), and concentrated under vacuum. Flash chromatography (silica gel, 10-20 % EtOAc-hexanes) gave 2.11g (85% based on the recovered starting material) of the desired 4-(3-Oxo-propyl)-benzoic acid methyl ester as a clear oil.

5 Step 2: To a solution of 5-chloro-2-methylindole (0.86g, 5.2mmol) and 4-(3-Oxo-propyl)-benzoic acid methyl ester (1.0g, 5.2mmol) in methylene chloride (50mL), was added TFA (1.78g, 15.6mmol), followed by triethylsilane (1.81g, 15.6mmol). The reaction mixture was stirred overnight, quenched with sat. NaHCO_3 solution (50mL), and the organic layer was washed with sat. NaHCO_3 solution, water, brine, and dried (Na_2SO_4). Solvent was removed under reduced pressure, and the residue was purified by flash column chromatography with 10-20% EtOAc/hexanes to yield the desired product in 94% (1.67g) yield.

10 Step 3: To a solution of the product from step 2 (1.66g, 4.86mmol) in DMF (20mL) was added NaH (60% in mineral oil, 0.24g, 5.83mmol) under N_2 atmosphere. The mixture was stirred for 1h at room temperature, followed by the dropwise addition of benzhydryl bromide (1.8g, 7.29mmol) in DMF (5mL). This reaction mixture was stirred overnight at room temperature. Water (500mL) was added to reaction mixture, it was extracted with EtOAc, washed with brine, dried (Na_2SO_4), and concentrated under reduced pressure to a brown syrup, which was purified by silica-gel chromatography using 10% EtOAc/hexanes as eluent to isolate 4 as a white solid in 59% (1.47g) yield.

20 Step 4: The product from above (1.46g, 2.87mmol) was dissolved in CCl_4 (14.5mL), followed by the addition of NBS (1.02g, 5.73mmol) and benzoyl peroxide (2mg). The reaction mixture was heated to reflux for 1h (until all the starting material disappeared). This mixture was cooled to room temperature, filtered and the solid was washed with CCl_4 . The filtrate was evaporated to a brown residue, which was dissolved in acetone (40mL) and water (4mL), Ag_2CO_3 (1.75g, 3.16mmol) was then added to this solution and after being stirred overnight at room temperature, it was filtered through celite, the solvent was evaporated under reduced pressure, and water was added to the residue. It was extracted with EtOAc, washed with brine, dried (Na_2SO_4), and evaporated to a syrup, which was purified by 10% EtOAc/hexanes to isolate the 2-formyl indole (1.13g) in 75% yield. Alternatively the

30

dibromide from the reaction with NBS could be poured into DMSO (10-20% concentration by weight) and stirred for 30 minutes at room temperature. When the reaction was deemed complete it was poured into water and the resulting precipitate was isolated by filtration, the cake was washed with water and dried to yield an essentially quantitative yield.

Step 5: To a solution of the 2 formyl indole from above (0.52g, 1mmol) in CH_3NO_2 (6.2mL) was added NH_4OAc (0.077g, 1mmol), the mixture was heated to reflux for 1h, NH_4OAc (0.077g, 1mmol) was then added, heating at reflux was continued for an additional 1h, NH_4OAc (0.077g, 1mmol) was added again and the heating continued for further 1h. The reaction mixture was allowed to attain room temperature, EtOAc (50mL) was added, followed by the addition of 100mL water. The aqueous layer was extracted with EtOAc , and the combined organic layers were washed with brine, dried (Na_2SO_4), and evaporated to a yellow foam, which was subjected to chromatographic purification using 10% EtOAc /hexanes as an eluent to yield 6 as a yellow foam in 68% yield (0.38g).

Step 6 : Zn(Hg) was made by adding HgCl_2 (3.4g, 7.2 mmol) to a mixture of Zn-dust (34.68g, 530.35mmol) and 5% HCl (38mL) in a 100mL beaker, this mixture was stirred vigorously for 10 min. Aqueous phase was decanted and added 38mL of 5% HCl again and the mixture was stirred for 10 min. Aqueous phase was decanted. This solid was added to the vinyl nitro compound 6 (15g, 26.57mmol) in THF (660mL) and conc. HCl (64.5mL). This mixture was stirred at room temperature for 1h, then at reflux for 15 min. The reaction mixture was cooled to room temperature and filtered through celite. Aq. NH_4OH solution (200mL) was added to the filtrate, stirred for 15 min and THF was removed under reduced pressure. The aqueous layer was extracted with CH_2Cl_2 , combined organic layer was washed with brine, dried (Na_2SO_4) and concentrated to a brown foam, which was purified by column chromatography by eluting the column with CHCl_3 in the beginning to remove non-polar impurities then with 2% MeOH/CHCl_3 to isolate the desired amine in 46% yield (6.1g)

Step 7: To the amine(1.0 equiv.) and sat. NaHCO_3 (0.14 M) in CH_2Cl_2 (0.07 M) was added α -toluenesulfonyl chloride (1.0 equiv.). After 1 h the mixture was poured into saturated sodium bicarbonate and extracted with CH_2Cl_2 . The combined organic phase was washed with brine, dried over sodium sulfate and purified by

column chromatography to afford 84% of the desired product.

Step 8: The resulting ester was hydrolyzed by stirring with 1N NaOH (5 equiv.) in THF (0.07 M) and enough MeOH to produce a clear solution. The reaction was monitored by TLC (10% MeOH-CH₂Cl₂) for the disappearance of starting material. The mixture was stirred overnight at room temperature and then concentrated, diluted with H₂O, and acidified to pH 2-4 using 1 M HCl. The aqueous phase was extracted with EtOAc and the organic phase was washed with brine, dried over sodium sulfate, and concentrated to afford the desired product in 100 % yield.
